Ella Fitzgerald Academy, Yonkers NY

Deforestation, when humans remove or thin forests for lumber or to use the land where the trees stood for crops, grazing, extraction (mining, oil, or gas), or development as the population increases and people migrate. A serious case that greatly affects the environment and terrestrial ecosystems.

The deforestation need to be resolved for the good of terrestrial ecosystems. The deforestation has been caused by, agricultural expansion, that cause wood extraction that is bad for the ecosystem because ecosystem deforestation mostly increase the proportion of the world's species threatened with extinction. This can cause radical changes in the distribution of ecosystems and species, rise in sea level, disappearance of glaciers and large extensions of coral, unpredictable and extreme weather such as droughts and storms. Another one is what the farmers cut down trees to have more land to grow corn or another things.

The deforestation is a delicate problem that has to have a solution for that I believed what the better solution to deforestation is that Plant a trees. Do not use paper (or reduce its use). Recycle and buy recycled products. Look for the FSC (Forest Stewardship Council) certificate in wood and products made with wood and also replace the trees cut for firewood by planting new plants to compensate for trees being cut down. This can help prevent deforestation because cutting down a tree and then planting it is a good way to return a tree that was destroyed with paper, if not It is used that means the end of deforestation because without paper the trees would not be felled and also to compensate with something that helps nature by planting plants.

In conclusion, deforestation has many causes, it can be due to the weather or by people who try to make money by cutting down trees and damaging the ecosystem, etc. but unfortunately some people continue to damage terrestrial ecosystems and do not use multiple and not so few solutions to be able to stop deforestation and extinction of animals in different terrestrial ecosystems at once.
